

## Article redirect

Inviato da roshan - 08/04/2012 08:47

---

I have a couple of articles that I want to redirect to another one when accessed.

[xyz.com/projects/{variable}/17-site-pages/76-thane-projects](#)

to

[xyz.com/projects/](#)

For example:

[xyz.com/projects/mumbai/17-site-pages/76-thane-projects](#)

to

[xyz.com/projects/](#)

[xyz.com/projects/pune/17-site-pages/76-thane-projects](#)

to

[xyz.com/projects/](#)

please help me with regex.

Thanks.

Hi.

For example:

xyz.com/projects/mumbai/17-site-pages/76-thane-projects

to

xyz.com/projects/

From URL: ^/projects/mumbai/17-site-pages/76-thane-projects\$

To URL: http://{siteurl}/projects

xyz.com/projects/pune/17-site-pages/76-thane-projects

to

xyz.com/projects/

From URL: ^/projects/pune/17-site-pages/76-thane-projects\$

To URL: http://{siteurl}/projects

Thanks for your reply.

Is there a wildcard approach, where we can have a single rule for the two. I will tell you the reason why. I have almost 70 city names with me apart from Mumbai and Pune. It will be almost impossible for me to create 70 redirect rules like you suggested below.

Regards.

Oh yes.

If you use just /mumbai/ in the from url, this rule matches any URL which contains this word. Also consider you can use a regular expression in the from URL and also some macros in the destination.

As example, now you are redirecting any old URL to the same destination. But you can build something like:

From URL: /projects/mumbai/

To URL: `http://{siteurl}/projects/newsection/{pathltrim /projects/mumbai/}{queryfull}`

With this rule the URL:

`xyz.com/projects/mumbai/17-site-pages/76-thane-projects`

Will be redirected to:

`xyz.com/projects/newsection/17-site-pages/76-thane-projects`

And so on for any matching URL. That's the ReDJ power... 🤖

Kind regards,

Luigi
