

Installed but doesn't work...?

Inviato da leisurepublishing - 15/05/2009 22:09

Hi,

I installed your component/plugin and set it to do the following-

1. Remove the meta generator tag (works good)
2. I added a custom meta item for a particular page as below and it didn't work:

URI: /archive/tom-dooley.html

Published: Yes

Order: 1

Title: Tom Dooley

Description:

Keywords: test

Robots: yes, yes, skip, skip, skip

None of the meta info is set and I don't know what's wrong. I triple-checked and the plugin 'tagmeta' is published/enabled. The meta information set within the article is overriding the meta info I'm putting in here, but on the article, there also is no keyword set and the keyword setting above is also not showing up.

Any suggestions?

=====

Thanks to you for trust and for using Tag Meta.

Enjoy,

Luigi
